INTERVIEW PRESENTATION

Andrew Kyshkan

Senior Full-Stack Developer

TypeScript · Angular · Node.js · PostgreSQL · GCP & AWS

Uzhhorod, Ukraine · andrew.kyshkan@gmail.com

May 2026

Who I am

Senior full-stack developer with six years of production experience across four high-stakes domains.

6+ yrs

Shipping production systems

Healthcare, fintech, e-commerce and SaaS — solo, in teams, and as a team lead.

End-to-end

Schema → UI → infra

TypeScript across the stack: Angular, Node.js / NestJS, PostgreSQL, GCP & AWS.

DDD

Clean Architecture & boundaries

The common thread across every project — testable seams, modular services, honest interfaces.

Career arc

Eight roles across five domains. Grouped by domain rather than listed chronologically.

Healthcare

1 role 2024 – 2026

Enterprise app for US market. NestJS, FHIR, Spanner, BigQuery, GCP.

Fintech

2 roles 2021 – 2023

Currency exchange SPA + fintech CRM. Team lead. Cross-platform mobile via Ionic + Capacitor.

E-commerce

2 roles 2023 – 2024

Solo-built cross-platform site (farca.one) + Angular/Express marketplace at scale.

SaaS

2 roles 2023 – 2024

Subscriptions, Stripe, OpenAI integrations, Chrome extension, AWS microservices.

EdTech

1 role 2020 – 2021

Front-end + design on an education SPA — where the craft started.

Education & Languages

M.Sc. Civil Engineering, Lviv Polytechnic (2022). English C1 · Ukrainian native · Spanish A2.

An achievement worth telling

farca.one — solo-built cross-platform e-commerce, aggregating ~2M products from 30+ boutiques worldwide

1

One developer

End-to-end ownership: design, frontend, backend, data, infra, store listings.

2

One codebase, three runtimes

Web (SEO-critical), iOS, and Android — shipped from a single Angular codebase.

3

Mobile-first, flaky networks

Users on the move with intermittent connectivity — performance and resilience mattered from day one.

Not my most recent project — but the most directly relevant to this role. Past peak today; used here as reflection on real engineering decisions.

Decisions & tradeoffs

Each decision has a cost. Naming the cost is the point.

Server-side rendering over a pure SPA

Why: Hundreds of thousands of product pages had to be crawlable.

Cost: Slower dev iteration, higher hosting cost, more moving parts in CI.

Capacitor wrapper over a true PWA

Why: Native app-store presence was strategically valuable and faster to ship.

Cost: Gave up a proper offline-first story — accepted as deliberate debt.

Self-hosted on Hetzner over managed cloud

Why: Predictable cost at expected traffic with full infra control.

Cost: All ops, security and observability fell on one person.

BullMQ + Redis to orchestrate boutique-feed parsing

Why: 30+ feeds, ~2M products: needed back-pressure, retries and dedup without losing updates.

Cost: An extra stateful component to monitor and back up.

Outcomes

What the project actually delivered.

~2M

products aggregated from 30+ boutiques

~400k

pages indexed in Google

~15k

monthly visitors at peak

3

runtimes shipped: web, iOS, Android

Stable through peak. Shipped from database schema to app-store listing — by one engineer.

What I'd do today

With three more years of perspective — and at higher stakes.

01

A true PWA

Service-worker lifecycle, IndexedDB for local persistence, background-sync for resilient writes — instead of a native wrapper.

02

Observability from day one

Structured logs, distributed traces, real-user metrics. Knowing the system before it breaks.

03

Clean boundaries from day one

Domain modules drawn before the first migration — not retrofitted after the third feature pivot.

Much of what farca needed in 2023, this kind of role needs now — at much higher stakes.

How I work today

Principles

- Clean Architecture — boundaries first, frameworks second
- Domain-Driven Design — language shared with the people the software serves
- Clean Code — small, testable units; honest naming
- Modular, microservice-friendly thinking even inside monoliths
- End-to-end ownership: I follow the bug from the UI to the index

Tooling — power user of AI agents

- Claude Code as a daily driver — with custom skills and plugins (e.g. oh-my-claudecode)
- OpenClaw for continuous day-to-day improvements
- Treat agents like a junior pair: they need clear specs, code reviews, and bounded scope
- *On farca I didn't use agents — pre-era. Today they're how I move faster without losing rigor.*

Why this role

Three reasons it fits — in order of how rare they are.

1

I trained as a civil engineer.

Master's in civil engineering from Lviv Polytechnic before I became a developer. Building tools for inspecting engineering structures is one of the few software domains where both halves of my background compound.

2

Offline-first PWA — the gap I now know how to close.

I shipped a cross-platform app under similar constraints once. I know where I cut corners and what I'd do this time.

3

The stack is where I'm sharpest.

Angular, Node.js / TypeScript, PostgreSQL, S3-compatible storage, GCP & AWS — minimal ramp-up, maximum time spent on the domain.

WORK SAMPLES & CONTACT

Thank you.

Happy to go deeper on any of this in conversation.
